**Research Focus**

Failure to recover after injury or illness is a significant health problem that is closely tied to a range of psychosocial factors including personality and coping styles, psychopathology, stress, work satisfaction, and financial factors. For the last 8 years my research group has published extensively on the issue of response bias, symptom exaggeration, and malingering, one set of factors associated with poor outcome in a variety of conditions. Ongoing and future research aims at better understanding the influence of social factors, personality, and psychopathology on outcome following illness or injury. This current focus continues my long-time study of psychological and neuropsychological assessment and psychometrics. I also maintain my interest in cognitive neuropsychology and the rare cases whose analysis from a cognitive and neuroanatomical perspective can shed new light on the relationship between the brain and behavior.
